CT SCAN KUB

TECHNIQUE: 1.0 mm reconstructed images from a scan performed reviewed on workstation using different window and level settings. Non-contrast CT KUB.

FINDINGS:

RIGHT KIDNEY:

Kidney is normal in size (bipolar length 11.1 cm) with smooth margins and preserved parenchymal thickness about 16mm. Mild dilatation of pelvicalyceal system is noted along with dilatation of ureter due to an obstructing calculus in the mid ureter at the level of crossing iliac vessels , it measures about 9.6mm in length and it width about 3.7mm. It means CT density is about 990HU. Few non obstructing renal concretions are seen. No definite obstructing renal calculus. No differential renal lesion or perinephric abnormality is noted. VUJ is unremarkable.

LEFT KIDNEY:

Kidney is normal in size (bipolar length 10.0 cm) with smooth margins and preserved parenchymal thickness about 15mm. No definite hydronephrosis or perinephric abnormality is noted. There is no ureteric calculus. Ureter is not dilated. VUJ is unremarkable.

Urinary bladder is normal. There is no vesical calculus. Uterus and ovaries are bulky.

Within the confines of non-contrast examination, visualized abdominopelvic viscera including liver, spleen, adrenals, gallbladder and pancreas do not show any abnormality. There is no bowel dilatation, abdominopelvic lymphadenopathy or ascites.

Visualized osseous structures do not show any abnormality.

Visualized lung bases are normal

CONCLUSION:

- **Right mid ureteric calculus with resulting mild upstream hydroureteronephrosis.**
